

AI/DS SYSTEM BUILDER CHECKLIST

Business Science

From AI Demo → Reliable AI + Data Science Workflow (the pattern that ships)

(1) The 3 layers

Layer 3 – AI/DS Workflow Reliability
state, retries, logging, evaluation, guardrails

Layer 2 – AI Reasoning
translate outputs into meaning + next actions + summaries

Layer 1 – Data Science
segmentation / forecasting / scoring / anomaly detection

(2) The “Minimum Viable Reliability” checklist

✓ **Inputs are defined**
(schema + required fields)

✓ **State is tracked**
(what step are we on, what's been done)

✓ **Retries exist**
(with backoff + failure limits and sans, errors)

✓ **Evaluation exists**
(spot checks, test set, or human rubric)

✓ **Guardrails exist**
(constraints, citations/grounding where needed)

What happened:
(1–2 bullets)

Why it matters:
(KPI impact)

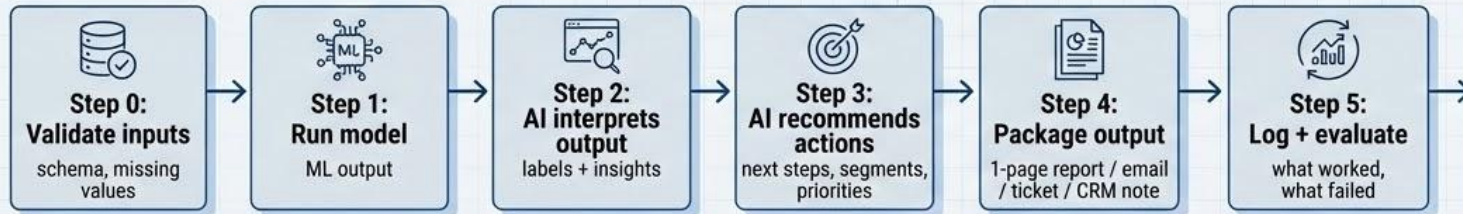

Who it affects:
(segment / cohort / category)

What to do next:
(3 actions max)

Confidence / caveats:
(what could be wrong)

Owner + next check-in:
(who acts, when reviewed)

(3) Workflow blueprint (copy/paste)

(5) The career ladder

Analyst

notebooks + insights

Builder

repeatable workflows

Operator

reliable systems
(state, retries, logging, eval)

(6) The weekly practice plan (simple)

Week 1 - Turn 1 analysis into a repeatable script

Week 2 - Add logging and input validation

Week 3 - Add AI interpretation and outcome validation

Week 4 - Add evaluation and failure handling
